

Distributed Algorithms 2021

6 Randomized algorithms

Recap

- **Deterministic algorithms in PN model**
 - $\text{init}_d(\dots)$, $\text{send}_d(\dots)$, $\text{receive}_d(\dots)$
- **Deterministic algorithms in LOCAL model**
 - add *unique identifiers*
- **Deterministic algorithms in CONGEST model**
 - add *bandwidth constraints*

Randomized algorithms

- **Randomized algorithms in PN model**
 - $\text{init}_d(\dots)$, $\text{receive}_d(\dots)$: *probability distribution*
- **Randomized algorithms in LOCAL model**
 - add unique identifiers
- **Randomized algorithms in CONGEST model**
 - add bandwidth constraints

Guarantees

- **Monte Carlo**

- *guaranteed* running time
- probabilistic output quality

- **Las Vegas**

- probabilistic running time
- *guaranteed* output quality

Guarantees

- **Monte Carlo**

- *guaranteed* running time
- probabilistic output quality

- **Las Vegas**

- probabilistic running time
- *guaranteed* output quality

- **“With high probability”** (w.h.p.)

Role of randomness

- Sometimes randomness is the only way to design fast distributed algorithms
- Example: **sinkless orientation**
 - deterministic LOCAL: $O(\log n)$ is best possible
 - randomized LOCAL: $O(\log \log n)$ w.h.p. is best possible

Role of randomness

- Sometimes randomness is just one of many ways to break symmetry
- Example:
 - *PN model* + randomness + knowledge of n : you can construct *unique identifiers* w.h.p.

Quiz

This week's quiz

- Random permutation of $\{1, \dots, 10\}$ in a 10-cycle
- Expected number of local maxima?

Video

Pretty simple idea:

- nodes are *active* with probability $1/2$
- only active nodes try to pick a *random free color*
- stop if successful

Simplest possible idea:

- everyone tries to pick a *random free color*
- stop if successful

Exam

Exam

- **Take-home exam**

- googling fine, asking someone for help not
- published \geq 24h before exam ends
- submit answers in MyCourses

- Grading: **pass/fail**

- or **pass/borderline/fail** if needed
- borderline can be upgraded to pass with some extra homework

Exam

- **Expected:**

- you know *exactly what is a distributed algorithm* (formally, not just waving hands)
- you can *design* new distributed algorithms
- you can *analyze* distributed algorithms, with the help of usual graph-theoretic concepts

- **Not needed:**

- memorizing technical details

What next?

What's coming next?

- **1st period:**

- models of distributed computing
- how to design fast distributed algorithms?

- **2nd period:**

- *how to prove impossibility results?*
- what cannot be solved at all in the PN model?
- what cannot be solved fast in the LOCAL model?
